| 2. What is the Factory Method pattern? | The Factory Method pattern allows a class to delegate the instantiation of objects to subclasses. |
| 3. What is the Strategy pattern? | The Strategy pattern defines a family of algorithms, places each algorithm into its own class, and makes an interface to define their common abstraction. |
| 4. What is the Observer pattern? | The Observer pattern defines a one-to-many dependency between objects so that when one object changes its state, all its dependents are notified and updated automatically. |
| 5. What is the Decorator pattern? | The Decorator pattern allows for runtime behavior modification by attaching objects to themselves and others. |
| 6. What is the Composite pattern? | The Composite pattern allows for recursive composition of objects to represent parts of a whole. |
| 7. What is the Builder pattern? | The Builder pattern separates the construction of a complex object from its representation. |

| 9. What is the Command pattern? | The Command pattern encapsulates a request as an object, allowing for parameterization of requests with queues, requests logging, and undoable requests. |
| 10. What is the State pattern? | The State pattern allows an object to alter its behavior when its internal state changes. |
| 11. What is the Template Method pattern? | The Template Method pattern defines a skeleton of an algorithm in a base class, allowing subclasses to override specific steps. |
| 12. What is the Chain of Responsibility pattern? | The Chain of Responsibility pattern passes a request through a chain of objects until the request is handled. |
| 13. What is the Null Object pattern? | The Null Object pattern provides a default object that implements the same interface as the non-null objects. |
| 14. What is the Memento pattern? | The Memento pattern captures and externalizes the state of an object so that it can be restored to that state later. |
| 15. What is the Visitor pattern? | The Visitor pattern separates an algorithm from the objects on which it operates. |
| 16. What is the Mediator pattern? | The Mediator pattern defines an interface that abstracts a set of interactions and binds the objects that need to communicate. |
